                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      monitoring HIV infection clearing ALDS, and 101 diagnosting and monitoring HIV infection claim 10; Page 79; 109pp; English.

mensh from the known hybridoms F105 was converted to cDNA and this subjected to PCR amplification using primers corresp. to appropriate parts of the heavy or light chains and having restriction sites to permit cloning. The extension prods, were isolated and sequenced. The recombinant human monoclonal antibody (MAD) binds to a discontinuous epitope on the HIV gpl20 envelope glycoprotein, blocks the binding of gpl20 to the CD4 receptor, and neutralises a broad range of HIV isolates. The MAD may be used to treat immune deficiency, esp. at doses of 0.1-10 mg/kg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               24 ltgspgflslsageratlscrasgsvssrylawygkpgaprlllygassratgipdrf 83

Disclosure: Page 74-75: 103pp; English
The nucleotide sequence of F105 Vk (642707 - sequence diffors from
other F105 Vk sequences given elsewhere in the specification) was
compared with germline gene HumvK325 (042706), showing 97.7%
similarity. By nucleotide sequence analysis. F105 appears to
be derived from a member of the Vk III subgroup gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA segments encoding monoclonal antibody - which binds to {\tt gpl20} and neutralises HIV, for treating AIDS, and for diagnosing and

chains which bind to the heavy light chain clones given in W0115-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunoreactive with HIV givesprotein gp41. This sequence represents "the sequence of the clone, GL 41. These sequences represent light chains which bind to the heavy light chain clones given in W01315. A modeclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml. The MAD may be used for determining immunocompetence of a human anti-HIV
                 Monoclonal antibody binding to VI/V2 loop of HIV spl20 - used in passive immuno:therapy and detection of HIV infection.

Example 3: Fig 19: 366pp. English.

The sequences given in W01320-24 represent the light chain variable regions (VH) of a series of antibody fragments (RAX s) which are immunoreactive with HIV glycoprotein gp41. This sequence represents the sequence of the clone, DL 4119. These sequences represent light
                                                                                                                                                                                                                                                                                                                                                                                                                 2 aeltqspgtlslspgervivscrasqsvssnylawyqqkpgqaprlliygasnratgipd 61

Lymphocyte mRNA was converted to CDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XL:
Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with glue and gp41 resulted in the recovery of immunoreactive clones. The light chain VL region sequence R54277 neutralises HIVI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2 aeltqspqtlslspgcratlscrasqsvsngylawyqqkpqqaprlll, qasttatdipd 61

The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli Xil Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence F5411 is from a gpl26-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 eltqspgtlslspgeratlscrasqslsnnylawyqqkpgqaprlliygsstrgtgipdr 60
